

Hello Candidate,

As you fulfill the requirements for the work profile, we would like to further evaluate your skills by providing the following assignment.

Before proceeding ahead we would like to inform you that we are looking for a PHP web developer so please proceed ahead if you follow the below requirements:

- You should be proficient in **PHP, HTML, and CSS** for web development
- You should have a good understanding of **hosting the website** on different hosting platforms like Hostinger, Hostgator, etc as we are using these platforms
- Our current website is a static website but we are planning to add blogs, customer reviews, etc and for that part, we will be using a **database (mostly SQL)**, so you should have a good understanding of databases and how to develop a dynamic website which fetches data from our database and show on the website.

For your reference, our current website link is: <https://femcarefertility.com/>

For the assignment part, you need to develop a single web page and host it to any free basic hosting platform for us to see.

Below are the assignment details:

1. The design page to be developed is also attached in the zip file
2. As mentioned above, we are looking for a PHP developer, so the assignment web page should be developed in PHP only.
3. You are free to use HTML and CSS as you like, so be a bit creative and you are free to add some of your own changes in the design that you think can improve the page design.
4. All the other required images and website logos are also added in the zip file.

If you have any queries please feel free to reach out to us.

All the best for the assignment.

Team Femcare Fertility
